Whitepaper The Strategic Building Blocks to Establish and Sustain Your Culture of Safety

DEKRA Organisational and Process Safety

Culture of Safety is about identifying and controlling exposure and creating an environment that is focused on **tota** worker wellbeing

What is a Culture of Safety?

In a Culture of Safety, the value an organisation has for safety is omnipresent. That value is embraced by leadership, visible in the physical conditions, observable in interactions between anyone at the organisation's location and is displayed in the way employees talk with pride about their safety achievements. Most importantly, a Culture of Safety is about identifying and controlling exposure and creating an environment that is focused on total worker wellbeing.

Exposure is the condition where the individual and the hazard intersect. A Culture of Safety, therefore, focuses on exposure in producing reliable safety performance, properly controlling both serious injuries and fatalities (SIFs) and catastrophic incidents. For this reason, a Culture of Safety is relevant both in organisational and process safety.

A Culture of Safety is the result of a greater focus in general than on just safety alone. Focusing on safety itself does not by itself create a Culture of Safety. Instead, a Culture of Safety is more holistic in the way it improves the experience of the employee, contractor and visitor. In fact, safety is not an independent variable in the equation of safety excellence.

Creating and maintaining safety excellence requires three strategic blocks to be present:

- High Organisational Functioning
- Human Performance Reliability
- A Learning Orientation

To explore this further, here is a breakdown of each.

It is the role people play in affecting how work is accomplished

High Organisational Functioning

High Organisational Functioning is the role people play in affecting how work is accomplished. To be effective requires four factors:

- input?
- on exposure.
- event.

• **Team Functioning.** How do the employees work together? Do they cooperate to accomplish important tasks? How do they approach one another? This quality is ultimately about teamwork.

• **Supervisor Functioning.** How do supervisors support and get the best out of their people? Are they fair in their decision-making? Are they approachable? Do they listen to and act upon employees'

Management Functioning. This factor is about how credible management is, balancing what they say with what they actually do; how management removes barriers that are system-based and tied to the organisational structure; and how management optimises the employee experience. This begins by making employees feel safe at work, showing ways that the organisation and senior leaders care about their safety and management's focus

• A Relentless Focus to Control Exposure. This factor is about supporting critical exposure identification in an effort to remove exposures that may cause a fatality, severe injury or a catastrophic

It is about being actionoriented, proactive and reliable

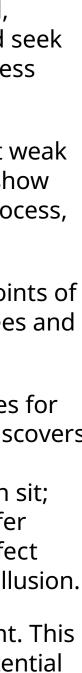

Human Performance Reliability

Human Performance Reliability is about being action oriented, proactive and reliable. It is about how people both take in and seek out information in an effort to make better decisions for flawless execution. It too involves four factors:

- Anticipation: With anticipation, the organisation seeks out weak signals of potential problems. In making inquiries, leaders show they are in a relentless pursuit of information and, in the process, are proactive in discovering system deficiencies.
- **Questioning**: Here, the organisation is open to different points of view and creates an inquisitive environment for its employees and leadership.
- **Diligence**: Diligence is about action. The organisation strives for flawless execution and minimising error. Once leadership discovers system deficiencies, they respond this is why they are transformational. Diligent leadership doesn't let information sit; instead, they are invested in driving change to enforce a safer organisation, and most importantly, they don't wait for perfect information to reveal itself knowing that perfect data is an illusion.
- **Resilience**: Ultimately, the organisation needs to be resilient. This means being ready and capable of intervening during a potential upset in the workflow.

It means people are seeking information to increase their **knowledge** and skills to solve problems effectively

Learning Orientation

Having a Learning Orientation means people are seeking information to increase their knowledge and skills to solve problems effectively. Building a learning orientation requires leaders who:

- organisation played in the outcome.
- protecting people.
- essential.
- as how people are managing the change.

• Do not blame workers. Instead, leaders identify root causes. They don't focus on who did what, but what happened and why. They will explore the processes, equipment, tools, environment and facilities that led the incident to happen. They'll also pursue what role the

• Innovate. These are leaders who are willing to think "out of the box" within a change management process. They are open to different ways of doing things to get to the same goal of avoiding disruptions, from minor failures to catastrophes.

• **Engage**. Too often leaders remain holed up in their offices and consider safety as something only frontline supervisors deal with. However, successful leaders create change in ways that increase productivity and commitment across all levels of the organisation, and they demonstrate their personal commitment to managing exposure and

Adapt. Transformational change leaders are agile, resilient, and are quick to respond to unexpected events. Strong safety leaders are ready to act and to switch gears, if necessary, to save lives. They understand change is a process and the ability to respond in overtime is

• **Reinforce**. To support learning, transformational leaders align behaviours, culture, and systems so they all support a successful change effort. They seek opportunities to coach around both the actual change as well

Culture of Safety is "how we do safety around here"

Connecting the Three Strategic Blocks of Safety Excellence

Simply defined, culture is "the way we do things around here." That logically would suggest that Culture of Safety is "how we do safety around here." The appeal of cultivating a culture of safety – beyond protecting people – is that it requires optimising the same systems and elements that support excellence across the general business. To sustain excellence, a Culture of Safety cultivates an effective functional organisation, with high human performance reliability strategies and continuous learning.

For example, the COVID-19 pandemic put a spotlight on organisations that were able to quickly and successfully respond to wholesale societal change. These are the same organisations that are most likely to survive any kind of changing landscape. In other words, they had the ability to:

When supported by these three strategic blocks, the culture of an organisation identifies and controls business exposure related to productivity, customer satisfaction, company reputation, financial performance, fiduciary and government responsibilities, and employees and community well-being.

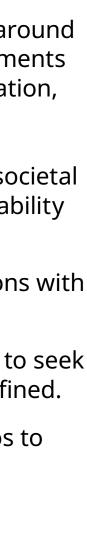

When applied to process and occupational safety, any organisation is capable of establishing and sustaining Culture of Safety Excellence.

• Adjust how their organisation functioned. In the case of COVID-19, this meant moving to virtual communication, sustaining connections with each other, adjusting client deliverables to meet changing customer needs.

• Maintain a careful listening and view of weak signals. Highly functional organisations also cultivated a sense of curiosity and urgency to seek the information and solve problems in new ways. They acted quickly and put protocols in place long before OSHA guidelines were defined.

• Learn new skills. They were quickly able to adopt to new technology, like virtual communication and find opportunities amid the chaos to develop new insights and help others grow and develop alongside them.

Leaders who ask the **right** questions can shape a culture that supports **good** function, performance reliability and learning

Questions Every Leader Needs to Ask to Create and Sustain a Culture of Safety

Leaders who ask the right questions can shape a culture that supports good function, performance reliability and learning. Here are 10 sets of questions leaders can start asking today to get their organisations on the right path – and keep them there:

- concerns, their fears?
- 2. Do we know the exposure map of our organisation? Especially:
- Where the serious injury and fatality exposures exist?
- The systems and controls that prevent a catastrophic event?
- How and when the most frequent injuries occur?
- Are we doing something different about control, both through our leadership and our support, to remove barriers for effective action?
- 3. Do we know the relationship between the supervisor and employees? Specifically:
- Are supervisors spending time on the floor with employees looking at process controls or personal exposure?
- Are they having conversations that are collaborative or always confrontational?

1. Do we as leaders understand our employees' experiences from their viewpoints? How do we know? Do we truly understand their

- 4. Are we as leaders paying attention to weak signals both the process and the concerns of employees?
- 5. Do we know whether or not what we did last year helped or hurt in how employees view us as safety leaders?
- 6. How are we promoting and reinforcing curiosity in our frontline employees and supervisors? Have we made it easy for people to speak up with concerns and ideas?
- 7. How do we model "thinking out of the box?" Do we show support for new ideas, even when they don't pan out?
- 8. How are we building agility and resilience? For example, are we as leaders providing positive feedback when an employee stops the line for something he or she thought was incorrect? Or, based on what we did, will that become the last time anyone stops the line?
- 9. How are leaders of our organisation taking steps to align behaviours, systems and culture to position everyone for success?
- 10. How are we coaching others to strengthen our organisation and prepare for the future?

DEKRA Organisational & Process Safety Contact

DEKRA Organisational and Process Safety are a behavioral change and process safety consultancy company. Working in collaboration with our clients, our approach is to assess the process safety and influence the safety culture with the aim of making a difference.

In terms of behavioral change, we deliver the skills, methods, and motivation to change leadership attitudes, behaviors, and decision-making among employees. Supporting our clients in creating a culture of care and measurable sustainable improvement of safety outcomes is our goal.

The breadth and depth of expertise in process safety makes us globally recognised specialists and trusted advisors. We help our clients understand and evaluate their risks, and we work together to develop pragmatic solutions. Our value-adding and practical approach integrate specialist process safety management, engineering, and testing. We seek to educate and grow client competence in order to provide sustainable performance improvement. Partnering with our clients, we combine technical expertise with a passion for life preservation, harm reduction and asset protection.

We are a service unit of DEKRA SE, a global leader in safety since 1925 with over 48,000 employees in 60 countries and five continents. As a part of the world's leading expert organisation DEKRA, we are the global partner for a safe world. We have offices throughout North America, Europe, and Asia.
