DEKRA

5 Things You Should Have in a BBS Management System

1 Feedback Tools

- Behavior-Based Safety is centered around peers giving feedback to one another, but what other feedback would be helpful? A true feedback system should allow reviewers, or managment, to give feedback on the quality of observations to increase engagement.

2 Follow Up Tracking

- Feedback is essential to the success of any BBS program, but what good is the information if there is no action behind it? A good system should have tools that help identify risk or barriers during observations and allow corrective actions to be created, assigned and tracked to completion.

3 Robust Reporting

- The best way to improve safety is to learn from the information you're already collecting. By having a system that allows you to easily access, analyze, trend and export information, you can identify risk efficiently and effectively. Ability to segment locations or view corporate wide is essential.

4 Alerting Functionality

- When risks or barriers are identified during observations, action needs to take place. How quickly that action happens, depends mainly on how quickly it's communicated and with what priority. A system with assignment and alerting functionality is critical to task completion.

5 Mobile

- Hand held technology is rapidly becoming the way of the world. The ability to access and enter observations from mobile devices creates the most efficient and effective way to collect data. The ability to capture and identify behaviors, barriers and risk with immediate data uploads, puts safety at the forefront of your organization.

DEKRA has the technology you're looking for.
